Preface

This is a work-in-progress [website](#) of support files for using matlab. Materials gathered from various [projects](#) in which matlab is used. Matlab files are linked below by section with livescript files. Tested with [Matlab](#) 2019a ([The MathWorks Inc, 2019](#)). This is not a Matlab package, but a list of examples in PDF/HTML/Mlx formats. [MEconTools](#) is a package that can be installed with tools used in projects involving matlab code.

Bullet points in the Appendix show which matlab functions/commands are used to achieve various objectives. The goal of this repository is to make it easier to find/re-use codes produced for various projects. Some functions also rely on or correspond to functions from [MEconTools](#) ([Wang, 2020](#)).

From other repositories: For dynamic borrowing and savings problems, see [Dynamic Asset Repository](#); For code examples, see also [R Example Code](#), and [Stata Example Code](#); For intro stat with R, see [Intro Statistics for Undergraduates](#), and intro Math with Matlab, see [Intro Mathematics for Economists](#). See [here](#) for all of [Fan](#)'s public repositories.

The site is built using [Bookdown](#) ([Xie, 2020](#)).

Please contact [FanWangEcon](#) for issues or problems.

Chapter 1

Data Structures

1.1 Matrices and Arrays

1.1.0.1 Accumarray Examples

Go back to fan's [CodeDynaAsset](#) Package, [Matlab Code Examples](#) Repository ([bookdown site](#)), or [Math for Econ with Matlab](#) Repository ([bookdown site](#)).

1.1.0.1.1 Accumarry Basic Example There are three unique values in `ar_a`, sum up the probabilities for each of the unique states. This is equivalent to sorting a matrix with `a` and `prob`, and computing sum for each.

```
ar_a = [3,2,1,3]';
ar_prob = [0.1,0.2,0.31,0.39]';
ar_sumprob = accumarray(ar_a, ar_prob);
tb_summed_prob = table(sort(unique(ar_a)), ar_sumprob);
disp(tb_summed_prob);
```

Var1	ar_sumprob
1	0.31
2	0.2
3	0.49

1.1.0.1.2 Accumarry For Discrete Random Variable Upon solving a model, if we look for the mass at certain choices or states, `accumarray` could help aggregate up probabilities

```
a1 = [1,1,2,2]
```

```
a1 = 1x4
     1     1     2     2
```

```
a2 = [3,2,1,3]
```

```
a2 = 1x4
     3     2     1     3
```

```
a3 = [1,2,3,3]
```

```
a3 = 1x4
     1     2     3     3
```

```
a = [a1;a2;a3]'/2
```

```
a = 4x3
    0.5000    1.5000    0.5000
    0.5000    1.0000    1.0000
    1.0000    0.5000    1.5000
    1.0000    1.5000    1.5000
```

```
prob_a = zeros(size(a)) + 1/12
```

```
prob_a = 4x3
    0.0833    0.0833    0.0833
    0.0833    0.0833    0.0833
    0.0833    0.0833    0.0833
    0.0833    0.0833    0.0833
```

```
[ar_idx_full, ~, ar_idx_of_unique] = unique(a)
```

```
ar_idx_full = 3x1
    0.5000
    1.0000
    1.5000
```

```
ar_idx_of_unique = 12x1
     1
     1
     2
     2
     3
     2
     1
     3
     1
     2
```

```
mt_idx_of_unique = reshape(ar_idx_of_unique, size(a))
```

```
mt_idx_of_unique = 4x3
     1     3     1
     1     2     2
     2     1     3
     2     3     3
```

```
accumarray(mt_idx_of_unique(:,1), prob_a(:,1))
```

```
ans = 2x1
    0.1667
    0.1667
```

```
accumarray(mt_idx_of_unique(:,2), prob_a(:,2))
```

```
ans = 3x1
    0.0833
    0.0833
    0.1667
```

```
accumarray(mt_idx_of_unique(:,3), prob_a(:,3))
```

```
ans = 3x1
    0.0833
    0.0833
    0.1667
```

1.1.0.2 Array Broadcast and Expansion Examples

back to [Fan's Reusable Matlab Repository](#) or [Dynamic Asset Repository](#).

Matrix broadcasting was added to matlab's recent editions. This is an important step for vectorizing codes. Proper usage of broadcasting reduces memory allocation requirements for matrix matrix operations.

1.1.0.2.1 Broadcasting with A Row and a Column Below we add together a 1 by 3 and 4 by 1 array, that should not work. With broadcasting, it is assumed that we will mesh the arrays and then sum up the meshed matrixes.

```
clear all
ar_A = [1,2,3];
ar_B = [4,3,2,1]';
disp(size(ar_A));
```

```
1    3
```

```
disp(size(ar_B));
```

```
4    1
```

```
mt_A_B_broadcast = ar_A + ar_B;
disp(mt_A_B_broadcast);
```

```
5    6    7
4    5    6
3    4    5
2    3    4
```

```
mt_A_B_broadcast_product = ar_A.*ar_B;
disp(mt_A_B_broadcast_product);
```

```
4    8   12
3    6    9
2    4    6
1    2    3
```

1.1.0.2.2 Broadcasting with One Row and One Matrix Below we add together a 1 by 3 and 4 by 3 matrix, that should not work. With broadcasting, it is assumed that we will repeat the array four times, duplicating the single row four times, so the matrix dimensions match up.

```
clear all
ar_A = [1,2,3];
mt_B = [4,3,2,1;5,4,3,2;6,5,4,3]';
disp(size(ar_A));
```

```
1    3
```

```
disp(size(mt_B));
```

```
4    3
```

```
mt_A_B_broadcast = ar_A + mt_B;
disp(mt_A_B_broadcast);
```

```

5      7      9
4      6      8
3      5      7
2      4      6
```

```
mt_A_B_broadcast_product = ar_A.*mt_B;
disp(mt_A_B_broadcast_product);
```

```

4      10     18
3       8     15
2       6     12
1       4       9
```

1.1.0.2.3 Broadcasting with One Column and One Matrix Below we add together a 4 by 1 and 4 by 3 matrix, that should not work. With broadcasting, it is assumed that we will repeat the column three times, duplicating the single column three times, so the matrix dimensions match up.

```
clear all
ar_A = [4,3,2,1]';
mt_B = [4,3,2,1;5,4,3,2;6,5,4,3]';
disp(size(ar_A));
```

```

4      1
```

```
disp(size(mt_B));
```

```

4      3
```

```
mt_A_B_broadcast = ar_A + mt_B;
disp(mt_A_B_broadcast);
```

```

8      9     10
6      7      8
4      5      6
2      3      4
```

```
mt_A_B_broadcast_product = ar_A.*mt_B;
disp(mt_A_B_broadcast_product);
```

```

16     20     24
9      12     15
4       6      8
1       2      3
```

1.1.0.2.4 Expand with Broadcast, Percentage Choice grids

```
clear all

1.1.0.5 Array Reshape, Repeat and Expand Examples

Go back to [fan's CodeDynaAsset](#) Package, [Matlab Code Examples](#) Repository ([bookdown site](#)), or [Math for Econ with Matlab](#) Repository ([bookdown site](#)).

1.1.0.5.1 Basic Examples of Reshape

```

a = [1,2,3,4,5,6]';
b = reshape(a, [3,2])

b = 3x2
     1     4
     2     5
     3     6

b(:)

ans = 6x1
     1
     2
     3
     4
     5
     6

a = [1,2,3;4,5,6;7,8,9;10,11,12] '

a = 3x4
     1     4     7    10
     2     5     8    11
     3     6     9    12

b = reshape(a, [6,2])

```

```
b = 6x2
    1     7
    2     8
    3     9
    4    10
    5    11
    6    12
```

1.1.0.5.2 Stack Two Matrix of Equal Column Count Together

```
a = [1,2;3,4];
a_stacked = [a;a;a];
disp(a_stacked);
```

```
    1     2
    3     4
    1     2
    3     4
    1     2
    3     4
```

1.1.0.5.3 Repeat/Duplicate Matrix Downwards There is a 2 by 3 matrix, to be repeated 4 times, downwards. This is useful for replicating data matrix for say counterfactual purposes.

Below, we have two ways of repeating a matrix downwards. Copy as whole, or copy row by row.

```
row_count = 2;
col_count = 3;
repeat_mat_count = 2;

data_vec = 1:(row_count*col_count);
searchMatrix = reshape(data_vec,row_count,col_count);

% To repeat matrix downwards
rep_rows_idx = [1:row_count]*ones(1,repeat_mat_count);
rep_rows_idx = rep_rows_idx(:);

rep_cols_idx = [1:col_count];
rep_cols_idx = rep_cols_idx(:);

searchMatrixRep_stack = searchMatrix(rep_rows_idx, rep_cols_idx);

% To insert repeated rows following original rows
rep_rows_idx = ([1:row_count]*ones(1,repeat_mat_count))';
rep_rows_idx = rep_rows_idx(:);

searchMatrixRep_dup = searchMatrix(rep_rows_idx, rep_cols_idx);

disp(searchMatrix)

    1     3     5
    2     4     6

disp(searchMatrixRep_stack)

    1     3     5
    2     4     6
    1     3     5
    2     4     6
```

```
disp(searchMatrixRep_dup)
```

```

1      3      5
1      3      5
2      4      6
2      4      6
```

1.1.0.5.4 Index Dimension Transform `it_inner_fin = 5; it_outter_fin = 3;`

```
it_inner_cur = it_outter_fin it_outter_cur = it_inner_fin
```

```
ar_it_cols_idx = 1:1:(it_inner_fin*it_outter_fin) ar_it_cols_inner_dim = repmat(1:it_inner_cur,
                                         it_outter_cur,1
```

```
) ar_it_cols_inner_dim(:)'
```

```
mt_it_cols_idx = reshape(ar_it_cols_idx,
```

```
it_inner_cur,it_outter_cur
```

```
)' mt_it_cols_idx(:)'
```

```
it_inner_fin = 5;
```

```
it_outter_fin = 3;
```

```
ar_it_cols_idx = 1:1:(it_inner_fin*it_outter_fin)
```

```
ar_it_cols_idx = 1x15
```

```

1      2      3      4      5      6      7      8      9     10     11     12     13     14     15
```

```
mt_it_cols_idx = reshape(ar_it_cols_idx, [it_outter_fin, it_inner_fin])'
```

```
mt_it_cols_idx = 5x3
```

```

1      2      3
4      5      6
7      8      9
10     11     12
13     14     15
```

```
mt_it_cols_idx(:)'
```

```
ans = 1x15
```

```

1      4      7     10     13      2      5      8     11     14      3      6      9     12     15
```

1.1.0.6 Array Index Slicing and Subsetting to Replace and Expand

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository](#) ([bookdown site](#)), or [Math for Econ with Matlab Repository](#) ([bookdown site](#)).

1.1.0.6.1 Matlab Index based Replacement of Subset of Matrix Values

```
clear all;
```

ans = 3x1
    1.3921
    1.0597
    1.1755

```

1.1.0.6.2 Matlab Matrix Index Based Matrix Expansion (Manual) In the example below, we start with a 4 by 2 matrix, than we expand specific rows and columns of the matrix. Specifically, we expand the matrix such that the result matrix repeats the 1st, 2nd, 1st, 2nd, then 3rd, than 1st, 1st, and 1st rows. And repeats column 1, then 2nd, then 2nd, then 2nd, and finally the first column.

```

% Original Matrix
Z = 2;
N = 2;
Q = 2;
base_mat = reshape(1:(Z*N*Q),Z*N,Q);
disp(base_mat);

```

```

2      6
3      7
4      8

% Expanded Matrix
base_expand = base_mat([1,2,1,2,3,1,1,1],[1,2,2,2,1]);
disp(base_expand);

```

```

1      5      5      5      1
2      6      6      6      2
1      5      5      5      1
2      6      6      6      2
3      7      7      7      3
1      5      5      5      1
1      5      5      5      1
1      5      5      5      1

```

1.1.0.6.3 Duplicate Matrix Downwards N times Using Index The example here has the same idea, but we do the operations above in a more automated way. This could be done using alternative methods.

```

% Original Matrix
Z = 2;
N = 2;
Q = 2;
base_mat = reshape(1:(Z*N*Q),Z*N,Q);
disp(base_mat);

```

```

1      5
2      6
3      7
4      8

```

```

% Generate row Index many times automatically depending on how many times
% to replicate
vmat_repeat_count = 3;
vmat_reindex_rows_repeat = [1:(Z*N)]'* ones(1,vmat_repeat_count);
vmat_reindex_rows_repeat = vmat_reindex_rows_repeat(:);
disp(vmat_reindex_rows_repeat');

```

```

1      2      3      4      1      2      3      4      1      2      3      4

```

```

% Duplicate Matrix by the Rows specified above, and using the same number
% of columns.
mat_repdown = base_mat(vmat_reindex_rows_repeat(:), 1:Q);
disp(mat_repdown');

```

```

1      2      3      4      1      2      3      4      1      2      3      4
5      6      7      8      5      6      7      8      5      6      7      8

```

1.1.0.6.4 Max of Matrix column by Column Linear to 2d Index Finding max of matrix column by column, then obtain the linear index associated with the max values.

```

randMat = rand(5,3);
disp(randMat);

```

```

0.4264    0.1156    0.4830

cl_st_param_keys = {'fl_wad', 'fl_betart', 'it_z_nfg'};

st_param = 'asdjfl';

[st_param, ls_st_param_key, cl_st_param_keys]

ans =
    {'asdjfl'}    {'fl_crra'}    {'fl_beta'}    {'fl_w'}    {'fl_r_save'}    {'fl_a_max'}    {'it_z_n'}

```

1.2.0.4 Nested Cells

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository](#) ([bookdown site](#)), or [Math for Econ with Matlab Repository](#) ([bookdown site](#)).

1.2.0.4.1 Nested Cells and access

```

cl_st_param_keys = {'fl_crra', 'fl_beta'};

it_simu_vec_len = 3;
clns_parm_tstar = cell([4,1]);
clns_parm_tstar{1} = {'fl_crra', 'CRRA', linspace(1, 2, it_simu_vec_len)};
clns_parm_tstar{2} = {'fl_beta', 'Discount', linspace(0.94, 0.98, it_simu_vec_len)};
clns_parm_tstar{3} = {'w', 'Wage', linspace(1.1, 1.4, it_simu_vec_len)};
clns_parm_tstar{4} = {'r', 'Save Interest', linspace(0.01, 0.04, it_simu_vec_len)};

```

```

disp(clns_parm_tstar(1));

    {1x3 cell}

disp(clns_parm_tstar{1}{1})

fl_crra

disp(clns_parm_tstar{1}{2});

CRRRA

disp(clns_parm_tstar{1}{3});

    1.0000    1.5000    2.0000

```

1.3 Characters and Strings

1.3.0.1 Basic String Operations

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository \(bookdown site\)](#), or [Math for Econ with Matlab Repository \(bookdown site\)](#).

1.3.0.1.1 Combine Char with Numeric Value

Compose a string with words and numerical values

```

st_title = strcat("Figure Title ", ...
    "(", ...
    "threedeci=%.3f", ...
    "twodeci=%.2f", ...
    "int=%.0f", ...
    ")");
ar_params = 123.4567 + zeros(1,3);
st_combo = compose(st_title, ar_params);
disp(st_combo);

Figure Title (threedeci=123.457,twodeci=123.46,int=123)

```

1.3.0.1.2 Change File Name MLX to M

```

st_file_name_mlx = 'continuous_differentiable.mlx';
at_st_split_file_name = split(st_file_name_mlx, ".");
st_file_name_m = strcat(at_st_split_file_name{1}, '_m.m');
disp(st_file_name_m);

continuous_differentiable_m.m

```

1.3.0.2 String Manipulations with Arrays

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository \(bookdown site\)](#), or [Math for Econ with Matlab Repository \(bookdown site\)](#).

1.3.0.2.1 String Array

Three title lines, with double quotes:

```

ar_st_titles = ["Title1","Title2","Title3"]';
disp(ar_st_titles);

    "Title1"
    "Title2"
    "Title3"

```

Three words, joined together, now single quotes, this creates one string, rather than a string array:

```
st_titles = ['Title1','Title2','Title3'];
disp(st_titles);
```

```
Title1Title2Title3
```

1.3.0.2.2 String Cell Array

```
ar_st_titles = {'Title1','Title2','Title3'};
disp(ar_st_titles);
```

```
'Title1'      'Title2'      'Title3'
```

1.3.0.2.3 Duplicate String

```
it_duplicate_n = 10;
disp(repmat({'String'}, [1, it_duplicate_n]));
```

```
'String'      'String'      'String'      'String'      'String'      'String'      'String'      'String'
```

1.3.0.2.4 String Join to form Single Element using char() is safe

```
st_var_name = "abc"
```

```
st_var_name = "abc"
```

```
st_var_name = [st_var_name ' percentile values']
```

```
st_var_name = 1x2 string array
"abc"          " percentile values"
```

```
strjoin(st_var_name)
```

```
ans = "abc percentile values"
```

```
st_var_name = "abc"
```

```
st_var_name = "abc"
```

```
st_var_name = [char(st_var_name) ' percentile values']
```

```
st_var_name = 'abc percentile values'
```

```
st_var_name = 'abc'
```

```
st_var_name = 'abc'
```

```
st_var_name = [char(st_var_name) ' percentile values']
```

```
st_var_name = 'abc percentile values'
```

1.3.0.2.5 String Join dash (Paste) This is similar to R's paste function:

```
st_var_name = "abc";
```

```
st_var_name = "abc"
```

```

st_var_name = [st_var_name, 'efg', 'mqo'];

st_var_name = 1x3 string array
"abc"      "efg"      "mqo"

disp(strjoin(st_var_name, "_"));

ans = "abc_efg_mqo"

disp(strjoin(st_var_name, ","));

```

1.3.0.2.6 Numeric Array to String without Space String replace

```

ar_it_test_grp = [3, 8, 9];
strrep(num2str(ar_it_test_grp), ' ', '_')

ans = '3_8_9'

```

1.3.0.2.7 Substring replace in Cell Array

```

ar_st_cells = {'shock=0.35','shock=0.40','shock=0.46'};
ar_st_updated_cells = strrep(ar_st_cells, 'shock', '$\epsilon$');
disp(ar_st_updated_cells);

'$\epsilon$=0.35'    '$\epsilon$=0.40'    '$\epsilon$=0.46'

```

1.3.0.2.8 Find position of String in String Cell

```

ls_st_param_key = {'fl_crra', 'fl_beta', ...
                  'fl_w', 'fl_r_save', ...
                  'fl_a_max', 'it_z_n', 'it_a_n'};
st_param_key = 'fl_a_max';
find(strcmp(ls_st_param_key, st_param_key))

ans = 5

```

1.3.0.2.9 Find the positions of String Cells in Full String Cells

```

ls_st_param_key = {'fl_crra', 'fl_beta', ...
                  'fl_w', 'fl_r_save', ...
                  'fl_a_max', 'it_z_n', 'it_a_n'};

cl_st_param_keys = {'fl_w', 'fl_beta', 'it_z_n'};

cell2mat(cellfun(@(m) find(strcmp(ls_st_param_key, m)), ...
                cl_st_param_keys, 'UniformOutput', false))

ans = 1x3
     3     2     6

find(strcmp(ls_st_param_key, st_param_key))

ans = 5

```

1.3.0.2.10 Cell to string Paste and Replace dash

```

cl_st_param_keys = {'fl_crra', 'fl_beta'};
display(strrep(strjoin(cl_st_param_keys, '-'), '-', '\_'));

```

```
fl\_crra-fl\_beta
```

1.3.0.3 Concatenate Strings Arrays with Numbers and Number Arrays with Strings

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository \(bookdown site\)](#), or [Math for Econ with Matlab Repository \(bookdown site\)](#).

1.3.0.3.1 Combine A String Array with A Numeric Array using Compose String array and numeric array, combine together using the compose function, and test different formatting functions. Formating with leading empty spaces, leading zeros, and convert to integer or not.

```
st_titles = ["%.3f",    "%.1f",    "%.0f";...
            "%6.3f",   "%6.1f",   "%6.0f";...
            "%06.3f", "%06.1f", "%06.0f"];
ar_params = 123.4567890 + zeros(3,3);
st_combo = compose(st_titles, ar_params);
disp(st_combo);
```

```
"123.457"    "123.5"    "123"
"123.457"    " 123.5"    "   123"
"123.457"    "0123.5"    "000123"
```

1.3.0.3.2 Title from an Array of Values There is a vector of parameter values and a vector of names for these parameter values, I want to include these in the title of a figure with the same decimal formating.

```
% Inputs
rng(123);
ar_params = rand(1,3);
ar_st_parms_names = ["param1", "param2", "param3"];
st_rounding = '.2f';
st_title_main = "this is the figure title";
% Rounding and combining
ar_st_params = strcat(ar_st_parms_names, compose(strcat("=", st_rounding), ar_params));
% Generate a Single String that is comma separated:
st_param_pasted = strjoin(ar_st_params, ', ');
% Generate title with parameters
st_title_wth_params = strcat(st_title_main, ' (', st_param_pasted, ')');
% Display:
disp(st_title_wth_params);
```

```
this is the figure title (param1=0.70, param2=0.29, param3=0.23)
```

1.3.0.3.3 Combine String with Numeric Array Example 1:

```
ar_fl_abc1 = [0.4 0.1 0.25 0.3 0.4];
disp([num2str(ar_fl_abc1', 'zw=%3.2f;'), num2str(ar_fl_abc1', 'zr=%3.2f')]);
```

Example 2:

```
close all;
```

```
rng(123);
ar_z_r_borr_mesh_wage = rand([1,5]);
ar_z_wage_mesh_r_borr = rand([1,5]);
ar_it_rows = round(rand([1,5])*10);
cl_st_full_rowscols = cellstr([num2str(ar_z_r_borr_mesh_wage', 'zr=%3.2f;'), ...
                               num2str(ar_z_wage_mesh_r_borr', 'zw=%3.2f')]);
cl_col_names = strcat('zi=', num2str(ar_it_rows([1,3,5])), ':', cl_st_full_rowscols([1,3,5]));
disp(ar_z_r_borr_mesh_wage);
```

```

    0.6965    0.2861    0.2269    0.5513    0.7195

disp(ar_z_wage_mesh_r_borr);

    0.4231    0.9808    0.6848    0.4809    0.3921

disp(cl_st_full_rowscols);

'zr=0.70;zw=0.42'
'zr=0.29;zw=0.98'
'zr=0.23;zw=0.68'
'zr=0.55;zw=0.48'
'zr=0.72;zw=0.39'

disp(cl_col_names);

'zi=3:zr=0.70;zw=0.42'
'zi=4:zr=0.23;zw=0.68'
'zi=4:zr=0.72;zw=0.39'

```

1.3.0.3.4 Combine Number with String Cell Array We have a string cell array we created from the previous section, now append numbers to it

```

% Append Common Numbers
cl_col_names_append = strcat(cl_col_names, '-String-Cell-With-Numeric-', num2str(123));
disp(cl_col_names_append);

'zi=3:zr=0.70;zw=0.42-String-Cell-With-Numeric-123'
'zi=4:zr=0.23;zw=0.68-String-Cell-With-Numeric-123'
'zi=4:zr=0.72;zw=0.39-String-Cell-With-Numeric-123'

```

1.3.0.3.5 Combine Numeric Array with String Cell Array Append an array of numeric values

```

% Append Common Numbers
cl_col_names_append = strcat(cl_col_names, '-String-Cell-With-Numeric-Array-', ...
    num2str(transpose(1:length(cl_col_names))));
disp(cl_col_names_append);

'zi=3:zr=0.70;zw=0.42-String-Cell-With-Numeric-Array-1'
'zi=4:zr=0.23;zw=0.68-String-Cell-With-Numeric-Array-2'
'zi=4:zr=0.72;zw=0.39-String-Cell-With-Numeric-Array-3'

```

1.3.0.3.6 Convert Numeric Array to String, Apend Prefix to all elements.

```

ar_fl_abc1 = [0.4 0.1 0.25 0.3 0.4];
ar_st_wth_prefix = strcat('row=', string(ar_fl_abc1));
disp(ar_st_wth_prefix);

% Does Array Exist in Longer Array as Subset
ar_abc1 = [0.4 0.1 0.25 0.3 0.4];
ar_abc2 = [0.4 0.1 0.2 0.3 0.4];
ar_efg = [0.1 0.2 0.3 0.4 0.1 0.2 0.3 0.4 0.1 0.2 0.3 0.4 0.1 0.2 0.3 0.4];
st_abc1 = strjoin(string(num2str(ar_abc1)));
st_abc2 = strjoin(string(num2str(ar_abc2)));
st_efg = strjoin(string(num2str(ar_efg)));
contains(st_efg, st_abc1)
contains(st_efg, st_abc2)

```

```
% Display Convert to String
fprintf('Display string [%s]', num2str([1,2,3]));
fprintf('Display string [%s]', num2str(1.1));
fprintf('Display string [%s]', 'abc');
```

1.4 Map Containers

1.4.0.1 Container Map Basics

Go back to [fan's CodeDynaAsset](#) Package, [Matlab Code Examples](#) Repository ([bookdown site](#)), or [Math for Econ with Matlab](#) Repository ([bookdown site](#)).

1.4.0.1.1 If key is in container

```
param_map_a = containers.Map('KeyType','char', 'ValueType','any');
param_map_a('fl_b_bd') = -3;
param_map_a('fl_w_max') = 50;
param_map_a('fl_kp_min') = 0;
param_map_a('it_w_i') = 100;

disp(isKey(param_map_a, 'it_w_i'));

1

disp(isKey(param_map_a, 'it_w_i1'));

0
```

1.4.0.1.2 Container Key Loop Generate new container key within loop dynamically

```
param_map_a = containers.Map('KeyType', 'char', 'ValueType','any');

rng(123);
for st_cur = ["abc", "efg", "qqq"]

    if (strcmp(st_cur, "abc"))
        data = rand([1,1]);
    elseif (strcmp(st_cur, "efg"))
        data = 123.123;
    elseif (strcmp(st_cur, "qqq"))
        data = -123;
    end

    % common function
    fl_sh_0p1pc_j = data*2 + 1;
    fl_sh_5pc_j = data/2 - 1;

    % generate map keys
    st_key_sh_0p1pc_j = strjoin([st_cur, 'sh_0p1pc_j'], "_");
    st_key_sh_5pc_j = strjoin([st_cur, 'sh_5pc_j'], "_");

    % store
    param_map_a(st_key_sh_0p1pc_j) = fl_sh_0p1pc_j;
    param_map_a(st_key_sh_5pc_j) = fl_sh_5pc_j;

end

disp(param_map_a.keys);
```

```

'abc_sh_0p1pc_j'    'abc_sh_5pc_j'    'efg_sh_0p1pc_j'    'efg_sh_5pc_j'    'qqq_sh_0p1pc_j'
disp(param_map_a.values);

[2.3929]    [-0.6518]    [247.2460]    [60.5615]    [-245]    [-62.5000]

```

1.4.0.2 Container Map Display Map Keys and Values

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository \(bookdown site\)](#), or [Math for Econ with Matlab Repository \(bookdown site\)](#).

1.4.0.2.1 Print Keys and Values Define container

```

% Define Container
param_map = containers.Map('KeyType','char', 'ValueType','any');
param_map('share_unbanked_j') = 12;
param_map('equi_r_j') = 2;
param_map('equi_w_j') = 'abc';
param_map('equi_P_j') = 1.2;

Print

param_map_keys = keys(param_map);
param_map_vals = values(param_map);
for i = 1:length(param_map)
    st_display = strjoin(['pos = ' num2str(i) ' ; key = ' string(param_map_keys{i}) ' ; val = ' string(pa
    disp(st_display);
end

pos = 1 ; key = equi_P_j ; val = 1.2
pos = 2 ; key = equi_r_j ; val = 2
pos = 3 ; key = equi_w_j ; val = abc
pos = 4 ; key = share_unbanked_j ; val = 12

```

1.4.0.3 Genereate Container Maps

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository \(bookdown site\)](#), or [Math for Econ with Matlab Repository \(bookdown site\)](#).

1.4.0.3.1 Generate a Container map with any time of data Create a container map with float, int, string, and matrix

```

close all;
clear all;

% Create A Map with String Keys and any values
param_map = containers.Map('KeyType','char', 'ValueType','any');
param_map('share_unbanked_j') = 12;
param_map('equi_r_j') = 2;
param_map('equi_w_j') = 'abc';
param_map('equi_P_j') = zeros(2,3);
param_map.keys

ans =
    {'equi_P_j'}    {'equi_r_j'}    {'equi_w_j'}    {'share_unbanked_j'}

param_map.values

ans =
    {2x3 double}    {[2]}    {'abc'}    {[12]}

```

1.4.0.3.2 Access Multiple Values of a container map Values been accessed need to be of the same type

```
% Parameter Dealing from Map
params_group = values(param_map, {'share_unbanked_j', 'equi_r_j'});
[equi_P_j, equi_r_j] = params_group{:}

equi_P_j = 12
equi_r_j = 2
```

```
% Access Scalar Elements of Map and Convert the Array
cell2mat(values(param_map, {'share_unbanked_j', 'equi_r_j'}))
```

```
ans = 1x2
    12     2
```

1.4.0.4 Container Map Example Overriding

Go back to [fan's CodeDynaAsset](#) Package, [Matlab Code Examples](#) Repository ([bookdown site](#)), or [Math for Econ with Matlab](#) Repository ([bookdown site](#)).

1.4.0.4.1 Update Container Map There is one map with values, Container Map A. There is another container Map, Container Map B. Container Maps A and B share keys. For keys that exist in B and A, B Key value supercede values for the same keys in A. For new keys in B, they superced keys in A.

```
param_map_a = containers.Map('KeyType','char', 'ValueType','any');
param_map_a('fl_b_bd') = -3;
param_map_a('fl_w_max') = 50;
param_map_a('fl_kp_min') = 0;
param_map_a('it_w_i') = 100;

param_map_b = containers.Map('KeyType','char', 'ValueType','any');
param_map_b('fl_w_max') = 77;
param_map_b('fl_kp_min') = -231;
param_map_b('it_z_n') = 5;
param_map_b('fl_z_mu') = 0;

param_map_c = [param_map_a; param_map_b];
param_map_c.keys

ans =
    'fl_b_bd'    'fl_kp_min'    'fl_w_max'    'fl_z_mu'    'it_w_i'    'it_z_n'

param_map_c.values

ans =
    [-3]    [-231]    [77]    [0]    [100]    [5]
```

Chapter 2

Functions

2.1 varargin Default Parameters

2.1.0.1 varargin as a Function Parameter

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository \(bookdown site\)](#), or [Math for Econ with Matlab Repository \(bookdown site\)](#).

2.1.0.1.1 Call Function with Two Parameters and Defaults Call function below without over-riding

```
ff_varargin(1.1, 2)

fl_a = 1.1000
it_b = 2
mt_data = 3x4
    0.6965    0.5513    0.9808    0.3921
    0.2861    0.7195    0.6848    0.3432
    0.2269    0.4231    0.4809    0.7290

ar_st_colnames = 1x4 string array
"col1"          "col2"          "col3"          "col4"

ar_st_rownames = 1x4 string array
"row1"          "row2"          "row3"          "row4"

st_table_name = "Table Name"
it_table_ctr = 1021
```

2.1.0.1.2 Override Subset of Varargin

```
rng(789);
mt_data_ext = rand(5,2);
ar_st_colnames = ["col1", "col2"];
ar_st_rownames = ["row1", "row2", "row3", "row4", "row5"];
ff_varargin(param_map, support_map, mt_data_ext, ar_st_colnames, ar_st_rownames);

fl_a =
    Map with properties:
        Count: 2
        KeyType: char
        ValueType: any
```

```

it_b =
    Map with properties:

        Count: 1
        KeyType: char
        ValueType: any

mt_data = 5x2
    0.3233    0.7589
    0.2302    0.0106
    0.7938    0.0247
    0.6244    0.1110
    0.9754    0.5381

ar_st_colnames = 1x2 string array
"col1"         "col2"

ar_st_rownames = 1x5 string array
"row1"         "row2"         "row3"         "row4"         "row5"

st_table_name = "Table Name"
it_table_ctr = 1021

```

2.1.0.1.3 Function with varargin as Inputs Basic default structure with varargin.

```

function ff_varargin(fl_a, it_b, varargin)
% This is an example of how to use varargin:
% 1. includes array matrix
% 2. includes array
% 3. includes scalar
% 4. includes string
% 5. includes cell array

%% Catch Error
cl_params_len = length(varargin);
if cl_params_len > 5
    error('ff_mat2tab:TooManyOptionalParameters', ...
        'allows at most 5 optional parameters');
end

%% Default Folder Parameters
% by default all go to Sandbox folder with sub folders by dates
rng(123);
mt_data = rand(3,4);
% String array requires double quotes
ar_st_colnames = ["col1", "col2", "col3", "col4"];
ar_st_rownames = ["row1", "row2", "row3", "row4"];
% Others
st_table_name = "Table Name";
it_table_ctr = 1021;
cl_params = {mt_data ar_st_colnames ar_st_rownames ...
             st_table_name it_table_ctr};

%% Parse Parameters
% numvarargs is the number of varargin inputted
[cl_params{1:cl_params_len}] = varargin{:};
% cell2mat(cl_params(1)) works with array
mt_data = cell2mat(cl_params(1));

```

```
% The structure below works with cell array
ar_st_colnames = cl_params{2};
ar_st_rownames = cl_params{3};
% Others
st_table_name = cl_params{4};
it_table_ctr = cl_params{5};

% Build Basic Matlab Table
% Suppose we want to store matrix results in a table,
% there are Q columns and N rows, The Q columns each is a different variable.
fl_a
it_b
mt_data
ar_st_colnames
ar_st_rownames
st_table_name
it_table_ctr

end
```

2.1.0.2 Map Based Default Parameter Structure with varargin

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository \(bookdown site\)](#), or [Math for Econ with Matlab Repository \(bookdown site\)](#).

2.1.0.2.1 Call Function with Default Parameters

Call function below without overriding

```
ff_defaultmap()

'c_gap'      'c_max'      'c_min'      'c_min_for_util'      'fl_crra'      'it_rown'      'st_single_double'

[1.0000e-03]      [60]      [1.0000e-03]      [1.0000e-03]      [1.5000]      [100]      'double'
```

Elapsed time is 0.000896 seconds.

2.1.0.2.2 Call Function overriding some Parameters

```
param_map = containers.Map('KeyType','char', 'ValueType','any');
param_map('fl_w_max') = 1.11;
param_map('it_w_i') = 2.22;
```

```
support_map = containers.Map('KeyType','char', 'ValueType','any');
support_map('bl_display') = true;
ff_defaultmap(param_map, support_map)
```

```
'c_gap'      'c_max'      'c_min'      'c_min_for_util'      'fl_crra'      'fl_w_max'      'it_rown'      'it

[1.0000e-03]      [60]      [1.0000e-03]      [1.0000e-03]      [1.5000]      [1.1100]      [100]      [2.2200]
```

Elapsed time is 0.000667 seconds.

2.1.0.2.3 Function with Map Defaults and Overriding This default parameter style is fairly succinct, allows for program testability, and easy adjustments/addition of additional parameters to models.

```
function ff_defaultmap(varargin)
```

```
% Parameters
params_len = length(varargin);
```

```

if params_len > 3
    error('ff_defaultmap:Can only have 3 container map parameters');
end

it_x_n = 10;
it_x_groups_n = 3;
mat_y = rand([it_x_n, it_x_groups_n]);
mat_y = mat_y + sqrt(1:it_x_groups_n);
mat_y = mat_y + log(1:it_x_n)';
ar_x = 1:1:it_x_n;
```

% Start Figure

```
figure('PaperPosition', [0 0 10 10]);
```

hold on;

```
g1 = scatter(ar_x, mat_y(:,1), 30, 'filled');
g2 = scatter(ar_x, mat_y(:,2), 30, 'filled');
g3 = scatter(ar_x, mat_y(:,3), 30, 'filled');
```

```
legend([g1, g2, g3], {'near', 'linear', 'spline'}, 'Location', 'best', ...
      'NumColumns', 1, 'FontSize', 12, 'TextColor', 'black');
```

% PLOT this line, but this line will not show up in legend

```
hline = reline([1 0]);
hline.Color = 'k';
hline.LineStyle = ':';
% not to show up in legend
hline.HandleVisibility = 'off';
grid on;
grid minor;
```

```
title(sprintf('griddedInterpolant comparison, crra utility approximation, interp grid n=%d', it_x_n))
```

```
ylabel('Actual Utility Evaluated at c')
xlabel('Approximated Util based on Interpolation')
```

```
snapnow;
```

3.1.0.2.3 Given Graph, Graph Subset of Lines and Add Extra Line with Legend Same plot as before, except we plot only 2 of the three lines and add another line with associated legend entry.

```
legendCell = cellstr(num2str(ar_x', 'shock=%3.2f'));
xlinemax = xline(min(mat_y, [], 'all'), 'all');
xlinemax.Color = 'b';
xlinemax.LineWidth = 1.5;

legendCell[length(legendCell) + 1] = 'max-agg-save';
legend([g1, g3, xlinemax], legendCell([1,3,length(legendCell)]), 'Location', 'best');
```

```
snapnow;
```

3.1.0.3 Matlab Graph Matrix with Jet Spectrum Color, Label a Subset Examples

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository \(bookdown site\)](#), or [Math for Econ with Matlab Repository \(bookdown site\)](#).

3.1.0.3.1 Plot a Subset of Data Matrix with Appropriate Legends Sometimes we solve a model across many states, but we can only plot at a subset of states, or perhaps we plot at all states, but only show legends/labels for a subset.

In the example below, many lines are plotted, however, only a subset of lines are labeled in the legend.

```
clear all;
close all;

% Generate Random Data
rng(123);
it_x_n = 10;
it_y_groups_n = 100;
ar_y = linspace(1,2,it_y_groups_n);
mat_y = rand([it_x_n, it_y_groups_n]);
mat_y = mat_y + sqrt(1:it_y_groups_n);
mat_y = mat_y + log(1:it_x_n)' + ar_y;
ar_x = 1:1:it_x_n;

% Jet color Graph All
figure('PaperPosition', [0 0 7 4]);
chart = plot(mat_y);
clr = jet(numel(chart));
for m = 1:numel(chart)
    set(chart(m), 'Color', clr(m,:))
end

% zero lines
```

```

xline(0);
yline(0);

% invalid points separating lines
yline_borrbound = yline(3);
yline_borrbound.HandleVisibility = 'on';
yline_borrbound.LineStyle = ':';
yline_borrbound.Color = 'black';
yline_borrbound.LineWidth = 3;

% Titling
title('Cash-on-Hand given w(k+b),k,z');
ylabel('Cash-on-Hand');
xlabel({'Index of Cash-on-Hand Discrete Point'...
      'Each Segment is a w=k+b; within segment increasing k'...
      'For each w and z, coh maximizing k is different'});

% Xlim controls

3.2 Basic Figure Types

3.2.0.1 Matlab Graph Scatter Plot Examples

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository](#) ([bookdown site](#)), or [Math for Econ with Matlab Repository](#) ([bookdown site](#)).

3.2.0.1.1 Scatter Plot Example The plot below as square scatter points, each one with thick border. Can set transparency of border/edge and inside separately.

```
close all;
figure();
size = 100;
s = scatter(1:10,1:10,size);

s.Marker = 's';
% color picked by using: uisetcolor
s.MarkerEdgeColor = [0 0.4471 0.7412];
s.MarkerEdgeAlpha = 0.5;
s.MarkerFaceColor = [.61 .51 .74];
s.MarkerFaceAlpha = 1.0;
s.LineWidth = 10;
grid on;
grid minor;
```

```
% 'o'   Circle
% '+'   Plus sign
% '*'   Asterisk
% '.'   Point
% 'x'   Cross
% 'square' or 's'   Square
% 'diamond' or 'd'   Diamond
% '^'   Upward-pointing triangle
% 'v'   Downward-pointing triangle
% '>'   Right-pointing triangle
```

```
% '<'    Left-pointing triangle
% 'pentagram' or 'p'    Five-pointed star (pentagram)
% 'hexagram' or 'h'    Six-pointed star (hexagram)
% 'none'    No markers
```

3.2.0.1.2 Scatter with Edge and Face Color and Transparency Here is another way to Set Scatter Edge and Fac Colors and Transparencies.

```
% Generate Data
rng(123);
it_x_n = 10;
it_x_groups_n = 3;

3.2.0.3 Matlab Graph Scatter and Line Spectrum with Three Variables

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository \(bookdown site\)](#), or [Math for Econ with Matlab Repository \(bookdown site\)](#).

Generate $k + b = w$, color for each w , vectors of k and b such that $k + b = w$ for each w

There are two N by M matrix, A and B .

Values in Matrix A correspond to the x-axis, values in Matrix B correspond to the y-axis.

The rows and columns in matrix A and B have some other meanings. In this case, we will give color to the columns.

The columns is represented by vector C , which is another variable.

1. Each line a different color representing variable 3
2. Legend labeling a subset of colors
3. X and Y could be asset choices, color could be utility, consumption etc.

3.2.0.3.1 Setting Up Data

```
close all
clear all

% Bounds
fl_b_bd = -10;
% Max and Mins
fl_w_max = 50;
fl_w_min = fl_b_bd;
fl_kp_max = fl_w_max - fl_b_bd;
fl_kp_min = 0;

% Grid Point Counts
it_w_i = 30;
it_kb_j = 30;
```

```

% Grids
ar_w = linspace(fl_w_min, fl_w_max, it_w_i);
ar_kp = linspace(fl_kp_min, fl_kp_max, it_kb_j);
mt_bp = ar_w - ar_kp';
mt_kp = ar_w - mt_bp;
mt_bl_constrained = (mt_bp < fl_b_bd);
mt_bp_wth_na = mt_bp;
mt_kp_wth_na = mt_kp;
mt_bp_wth_na(mt_bl_constrained) = nan;
mt_kp_wth_na(mt_bl_constrained) = nan;

% Flatten
ar_bp_mw_wth_na = mt_bp_wth_na(:);
ar_kp_mw_wth_na = mt_kp_wth_na(:);
ar_bp_mw = ar_bp_mw_wth_na(~isnan(ar_bp_mw_wth_na));
ar_kp_mw = ar_kp_mw_wth_na(~isnan(ar_kp_mw_wth_na));

```

3.2.0.3.2 Graphing

```

figure('PaperPosition', [0 0 7 4]);
hold on;

chart = plot(mt_bp_wth_na, mt_kp_wth_na, 'blue');

clr = jet(numel(chart));
for m = 1:numel(chart)
    set(chart(m), 'Color', clr(m,:))
end
if (length(ar_w) <= 50)
    scatter(ar_bp_mw, ar_kp_mw, 5, 'filled');
end
xline(0);
yline(0);

title('Choice Grids Conditional on  $kp+bp=w$ ')
ylabel('Capital Choice')
xlabel({'Borrowing or Saving'})
legend2plot = fliplr([1 round(numel(chart)/3) round((2*numel(chart))/4) numel(chart)]);
legendCell = cellstr(num2str(ar_w, 'kp+bp=%3.2f'));
legend(chart(legend2plot), legendCell(legend2plot), 'Location', 'northeast');

grid on;

```

3.3 Write and Read Plots

3.3.0.1 Matlab Graph Generate EPS postscript figures in matlab

Go back to fan's [CodeDynaAsset](#) Package, [Matlab Code Examples](#) Repository ([bookdown site](#)), or [Math for Econ with Matlab](#) Repository ([bookdown site](#)).

3.3.0.1.1 Properly Save EPS with Scatter and Other Graphing Methods: `Renderer = Painters`

scatter plot saving as eps seems to only work when `Renderer` is set to `Painters`

```
fl_fig_wdt = 3;
fl_fig_hgt = 2.65;

figure('PaperPosition', [0 0 fl_fig_wdt fl_fig_hgt], 'Renderer', 'Painters');
x = rand([10,1]);
y = rand([10,1]);
scatter(x, y, 'filled');
grid on;
grid minor;

st_img_path = 'C:/Users/fan/M4Econ/graph/export/_img/';
st_file_name = 'fs_eps_scatter_test';

% eps figure save with tiff preview
print(strcat(st_img_path, st_file_name), '-depsc', '-tiff');
```

Chapter 4

Tables

4.1 Basic Table Generation

4.1.0.1 Named Tables with Random Data

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository \(bookdown site\)](#), or [Math for Econ with Matlab Repository \(bookdown site\)](#).

4.1.0.1.1 Generate A Table with M Variables Generate a numeric table with random varlues and a string column

```
% Numeric Matrix
it_num_cols = 4;
it_num_rows = 5;
mt_data = rand([it_num_rows, it_num_cols]);

% Generate Table
tb_test = array2table(mt_data);

% Generate Row and Column Names
cl_col_names = strcat('col_', string((1:it_num_cols)));
cl_row_names = strcat('row_', string((1:it_num_rows)));

tb_test.Properties.VariableNames = matlab.lang.makeValidName(cl_col_names);
tb_test.Properties.RowNames = matlab.lang.makeValidName(cl_row_names);

% Generate two string variable
rng(456);
cl_st_var1 = strcat('data=', string(rand([it_num_rows,1])));
cl_st_var2 = strcat('data=', string(rand([it_num_rows,1])));
tb_test = addvars(tb_test, cl_st_var1, cl_st_var2);

% Display Table
disp(tb_test);
```

	col_1	col_2	col_3	col_4	cl_st_var1	cl_st_var2
	-----	-----	-----	-----	-----	-----

4.1.0.3 Row and Column names for Table based on Arrays

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository](#) ([bookdown site](#)), or [Math for Econ with Matlab Repository](#) ([bookdown site](#)).

4.1.0.3.1 Generate Table with Row and Column Names based on Multiple Numeric Array

Two numeric arrays describe the column names, combine numeric arrays together to form string array which becomes table variable/column names.

```
close all;
```

```
% Generate Table 1
```

```

ar_fl_abc1 = [0.4 0.1 0.25 0.3 0.4];
ar_fl_abc2 = [0.4 0.1 0.2 0.3 0.4];
number1 = '123';
number2 = '456';
mt_data_a = [ar_fl_abc1' ar_fl_abc2'];

tb_test_a = array2table(mt_data_a);
cl_col_names_a = {'col' num2str(number1)}, ['col' num2str(number2)]};
cl_row_names_a = strcat('rowA=', string((1:size(mt_data_a,1)))));

tb_test_a.Properties.VariableNames = cl_col_names_a;
tb_test_a.Properties.RowNames = cl_row_names_a;
disp(tb_test_a);

```

	col123	col456
	-----	-----
rowA=1	0.4	0.4
rowA=2	0.1	0.1
rowA=3	0.25	0.2
rowA=4	0.3	0.3
rowA=5	0.4	0.4

4.1.0.3.2 Include Row Names as a Variable

```

% a and b must have the same row names
varrownames = tb_test_a.Properties.RowNames;
tb_test_a = addvars(tb_test_a, varrownames, 'Before', 1);

disp(tb_test_a);

```

	varrownames	col123	col456
	-----	-----	-----
rowA=1	{'rowA=1'}	0.4	0.4
rowA=2	{'rowA=2'}	0.1	0.1
rowA=3	{'rowA=3'}	0.25	0.2
rowA=4	{'rowA=4'}	0.3	0.3
rowA=5	{'rowA=5'}	0.4	0.4

4.2 Table Joining

4.2.0.1 Combining Tables and Matrixes Together

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository](#) ([bookdown site](#)), or [Math for Econ with Matlab Repository](#) ([bookdown site](#)).

4.2.0.1.1 Generate Some Tables and Matrixes for Combination

```

close all;

% Generate Table 1
ar_fl_abc1 = [0.4 0.1 0.25 0.3 0.4];
ar_fl_abc2 = [0.4 0.1 0.2 0.3 0.4];
number1 = '123';
number2 = '456';
mt_data_a = [ar_fl_abc1' ar_fl_abc2'];

tb_test_a = array2table(mt_data_a);

```

```
cl_col_names_a = {'col' num2str(number1)}, ['col' num2str(number2)]];
cl_row_names_a = strcat('rowA=', string((1:size(mt_data_a,1))));
```

```
tb_test_a.Properties.VariableNames = cl_col_names_a;
tb_test_a.Properties.RowNames = cl_row_names_a;
disp(tb_test_a);
```

	col123	col456
	-----	-----
rowA=1	0.4	0.4
rowA=2	0.1	0.1
rowA=3	0.25	0.2
rowA=4	0.3	0.3
rowA=5	0.4	0.4

```
% Generate Table 2
```

```
rng(123);
ar_fl_abc3 = rand(size(ar_fl_abc1));
ar_fl_abc4 = rand(size(ar_fl_abc1));
ar_fl_abc5 = rand(size(ar_fl_abc1));
```

```
mt_data_b = [ar_fl_abc3' ar_fl_abc4' ar_fl_abc5'];
```

```
tb_test_b = array2table(mt_data_b);
cl_col_names_b = {'col' num2str(33)}, ['col' num2str(44)}, ['col' num2str(55)]];
cl_row_names_b = strcat('rowB=', string((1:size(mt_data_a,1))));
```

```
tb_test_b.Properties.VariableNames = cl_col_names_b;
tb_test_b.Properties.RowNames = cl_row_names_b;
disp(tb_test_b);
```

	col33	col44	col55
	-----	-----	-----
rowB=1	0.69647	0.42311	0.34318
rowB=2	0.28614	0.98076	0.72905

Chapter 5

Panel

5.1 Time Series

5.1.1 Simulate AR(1) Autoregressive Processes

Go back to [fan's CodeDynaAsset Package](#), [Matlab Code Examples Repository \(bookdown site\)](#), or [Math for Econ with Matlab Repository \(bookdown site\)](#).

5.1.1.1 Mean and Standard Deviation for AR(1) Autoregressive Process

A first-order autoregressive process can be written as:

- AR1: $X_t = \text{constant} + \text{persistence} \cdot x_{t-1} + \epsilon$
- AR1: $X_t = C + \rho \cdot x_{t-1} + \epsilon$

Assume that ϵ is mean zero

Note that, we know the mean of X :

- $\mu_X = C + \rho \cdot \mu_X + 0$
- $\mu_x = \frac{C}{1 - \rho}$

Note that, we also know the standard deviation of X :

- $\text{var}(X) = \rho^2 \cdot \text{var}(X) + \text{var}(\epsilon)$
- $\sigma_x = \sqrt{\frac{\sigma_\epsilon^2}{1 - \rho^2}}$

We will let the initial point of the time series follow the stationary distribution of the AR(1) process, then we simulate the time series over 100 periods, in the example below, we use a highly persistent shock process with $\rho = 0.98$, $\sigma_\epsilon = 0.02$, $C = 0.02$. Note that for this process:

- $\mu_x^{\rho=0.98, \sigma_\epsilon=0.02, C=0.02} = \frac{0.02}{1 - 0.98} = 1$
- $\sigma_x^{\rho=0.98, \sigma_\epsilon=0.02, C=0.02} = \sqrt{\frac{0.02^2}{1 - 0.98^2}} \approx 0.10$

5.1.1.2 Simulated one First-Order Autoregressive Time-Series

In the Example below, we simulate an individual for 1000 periods, given $\rho = 0.98$, $\sigma_\epsilon = 0.02$, $C = 0.02$. Given that the process is highly persistent, the individual stays rich or poor for dozens of periods at a time. If each period is a year, look at the results below, and suppose the simulated time series is income, what is the process saying about this person's income rise and fall. Note that we have the same person through all 1000 periods, but if you only look at 50 periods (years), you might think this person during

one span is really successful, another segment of 50 years, doing really bad, but actually there is nothing changing in the person's type, all that is changing is the person's luck.

First Set Parameters:

```
% Number of Time Periods
it_T = 1000;
% Mean and SD of the Shock Process
fl_constant = 0.02;
fl_normal_sd = 0.02;
% Persistence
fl_persistence = 0.98;
% Bounds on Shocks
fl_shk_bnds = 3;
% Initialize with exo fed point or not, if false initialize at Random Point
% from the stationary distribution
bl_init = true;
fl_init = fl_constant/(1 - fl_persistence);
```

Second, generate a vector of normal shocks:

```
% Generate a normal shock vector (the first draw will be ignored)
it_draws = it_T;
rng(789);
ar_fl_shocks = normrnd(0, fl_normal_sd, 1, it_draws);
disp(ar_fl_shocks(1:20));
```

Columns 1 through 13

```
-0.0060    -0.0047     0.0168     0.0118     0.0380     0.0062    -0.0616    -0.0485    -0.0192     0.0023
```

Columns 14 through 20

```
-0.0089     0.0160     0.0099    -0.0200    -0.0206    -0.0090    -0.0069
```

Third, replace any values exceeding bounds:

```
% out of bounds indicators
fl_shk_bds_lower = 0 - fl_normal_sd*fl_shk_bnds;
fl_shk_bds_upper = 0 + fl_normal_sd*fl_shk_bnds;
ar_bl_outofbounds = (ar_fl_shocks <= fl_shk_bds_lower | ar_fl_shocks >= fl_shk_bds_upper);
% count out of bounds
disp(strcat('lower:', num2str(fl_shk_bds_lower), ', upper:', num2str(fl_shk_bds_upper)));
```

lower:-0.06, upper:0.06

```
disp(sum(ar_bl_outofbounds));
```

4

```
ar_fl_shocks(ar_fl_shocks <= fl_shk_bds_lower) = fl_shk_bds_lower;
ar_fl_shocks(ar_fl_shocks >= fl_shk_bds_upper) = fl_shk_bds_upper;
```

Fourth, generate the AR(1) time series:

```
% Initialize Output Array
ar_fl_time_series = zeros(size(ar_fl_shocks));
% Loop over time
for it_t=1:length(ar_fl_shocks)
    if (it_t == 1)
        % initialize using the mean of the process
        ar_fl_time_series(1) = fl_constant/(1 - fl_persistence);
```

```

        if (bl_init)
            ar_fl_time_series(1) = fl_init;
        end
    else
        fl_ts_t = fl_constant + ar_fl_time_series(it_t-1)*fl_persistence + ar_fl_shocks(it_t);
        ar_fl_time_series(it_t) = fl_ts_t;
    end
end
end

```

Fifth, show the mean and sd of the process (these are very close to the analytical results):

```

disp(mean(ar_fl_time_series));

    1.0104

disp(std(ar_fl_time_series));

    0.1000

```

Sixth, plot the results:

```

figure();
% x-axis
ar_it_time = 1:1:length(ar_fl_shocks);
% plot
plot(ar_it_time, ar_fl_time_series);
% Generate Title
ar_fl_params_values = [fl_constant, fl_normal_sd, fl_persistence, fl_shk_bnds];
ar_st_parms_names = ["C", "sd", "persistence", "sd-bounds"];
st_rounding = '.2f';
st_title_main = "AR(1) ";
ar_st_params = strcat(ar_st_parms_names, compose(strcat("=%", st_rounding), ar_fl_params_values));
st_param_pasted = strjoin(ar_st_params, ', ');
st_title_with_params = strcat(st_title_main, ' (', st_param_pasted, ')');
title({st_title_with_params, 'Simulate One Individual for 1000 Periods'});
% X and Y labels
ylabel({'Time Series Values'});
xlabel('Time Periods');
grid on;

```

Appendix A

Index and Code Links

A.1 Data Structures links

A.1.1 Section 1.1 Matrices and Arrays links

1. [Accumarray Examples](#): [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Accumarray to sum up probabilities/values for discrete elements of arrays.
 - **m**: `unique() + reshape() + accumarray()`
2. [Array Broadcasting Examples](#): [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - broadcast means: array + array' + matrix = matrix.
3. [Array Random Draws and Permutation](#): [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Draw randomly from array, permute arrays.
 - **m**: `ndgrid() + cell2mat(cellfun(@(m) m(:), cl_mt_all, 'uni', 0))`
4. [Imaginary Elements of Array](#): [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Find imaginary elements of array.
 - **m**: `imag()`
5. [Array Reshape, Repeat and Expand](#): [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Reshape and flatten arrays.
 - **m**: `reshape()`
6. [Array Index Slicing and Subsetting to Replace and Expand](#): [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Index based column and row expansions.
 - Anonymous function to slice array subsets.
 - **m**: `sub2ind() + @(it_subset_n, it_ar_n) unique(round(((0:1:(it_subset_n-1))/(it_subset_n-1)) times (it_ar_n-1)+1))`
7. [Grid States, Choices and Optimal Choices Example](#): [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - States, choices, and find max.

A.1.2 Section 1.2 Cells links

1. [List Comprehension with Cells](#): [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Cell2mat, cellfun, anonymous function list comprehension over cells.
 - Find min and max of all arrays in cells.
 - Find length of all arrays in cells; find index of elements of one array in another cell array.
 - **m**: `cell2mat() + cellfun() + strcmp() + find() + cell2mat(cellfun(@(m) find(strcmp(ls_st_param_key, m)), cl_st_param_keys, 'UniformOutput', false))`
2. [Permutate Cells](#): [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Generate all possible combinations of various arrays contained in cell array.
 - **m**: `ndgrid() + cell2mat() + array2table() + cell2mat(cellfun(@(m) m(:), cl_mt_all, 'uni', 0))`
3. [Combine Cells](#): [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Combine string cell arrays and string.
 - **m**: `[{st_param}, ls_st_param_key, cl_st_param_keys]`
4. [Nested Cells](#): [mlx](#) | [m](#) | [pdf](#) | [html](#)

- Cell of cells with inner cell having multiple types.
- **m**: `linspace()` + `cell([4,1])` + `clns_parm_tstar{1}` = `{'fl_crra', 'CRRa', linspace(1, 2, it_simu_vec_len)}` + `disp(clns_parm_tstar(1))` + `disp(clns_parm_tstar{1}{1})`

A.1.3 Section 1.3 Characters and Strings links

1. String Basics: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Compose string and rounded numeric array.
 - Cut string suffix and append new suffix.
 - **m**: `*compose()` + `str_sub` = `split(string, “”) + strcat(str_sub{1}, ‘_m.m’)*`
2. String Arrays Operations: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - String arrays and cell strings.
 - Duplicate strings, concatenate string, and paste strings jointly with separator.
 - Find string element positions, replace substrings.
 - **m**: `repmat()` + `num2str()` + `strcat()` + `strjoin()` + `fprintf()` + `strcmp()` + `strrep()` + `cel2mat(cellfun(@(m) find(strcmp())))`
3. String and Numeric Array Concatenations: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Generate rounded string array matrix with leading zero, leading space, decimal round from numeric matrix.
 - Create a title string by joining rounded parameter and parameter names.
 - Concatenate multiple numeric arrays together with strings and format.
 - **m**: `compose()` + `cellstr()` + `strcat()` + `strjoin()` + `%.2f`

A.1.4 Section 1.4 Map Containers links

1. Container Map Basics: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Numeric container map, dynamically filled container map.
 - **m**: `isKey()` + `strjoin()` + `containers.Map('KeyType', 'char', 'ValueType', 'any')`
2. Display Container Map Keys and Values: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Loop over map, display keys and values.
 - **m**: `strjoin()` + `keys(map)` + `values(map)`
3. Container Map Varied Value Type: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Numeric scalar, string, matrix as values for map container.
 - Get values for multiple keys in map.
 - **m**: `map.keys()` + `map.values()` + `values(param_map, {'share_unbanked_j', 'equi_r_j'})`
4. Cell Override: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Override default map with externally fed map, update existing and add new keys.
 - **m**: `param_map_updated` = `[param_map_old; param_map_updates_new]`

A.2 Functions links

A.2.1 Section 2.1 varargin Default Parameters links

1. Use varargin as a Function Parameter: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Default parameters allow for maintaining code testability.
 - Use varargin for functions with limited parameters.
 - **m**: `varargin` + `cell2mat()` + `function [out_put] = func_name(varargin)`
2. Use varargin as a Function Parameter: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - The varargin structure could lead to excessive code lines. Container Map works well with large parameter structure.
 - Core model functions with potentially many parameters, possibly override default generation to save time.
 - **m**: `varargin` + `function [out_put] = func_name(varargin)` + `cm_defaults` = `{cm_a, cm_b}` + `[cm_defaults{1:optional_params_len}] = varargin{:}` + `cm_c` = `[cm_a;cm_b]`

A.3 Graphs links

A.3.1 Section 3.1 Figure Components links

1. Image Pick Safe Colors: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Display safe colors.
 - **m**: `blue = [57 106 177]/255 + fill(x, y, cl_colors{it_color})`
2. Figure Titling and Legend: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Multi-line titles, add legend lines.
 - Add to legend, select legend to show.
 - **m**: `title({'Cash-on-Hand' '\alpha + \beta = \zeta'}, 'Interpreter', 'latex') + legend([g1, g2, g3], {'near', 'linear', 'spline'}, 'Location', 'best', 'NumColumns', 1, 'FontSize', 12, 'TextColor', 'black');`
3. Graph Many Lines Legend for Subset: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - State-space plots with color spectrum: can not show all states in legend, show subset, add additional line to plot and legend.
 - **m**: `jet() + numel() + fliplr() + jet(numel(chart)), set(chart(m), 'Color', clr(m,:))`

A.3.2 Section 3.2 Basic Figure Types links

1. Scatter Plot Examples: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Scatter multiple lines different colors, shapes and sizes.
 - **m**: `scatter(x, y, size) + Marker + MarkerEdgeColor + MarkerEdgeAlpha + MarkerFaceColor + MarkerFaceAlpha`
2. Scatter Plot Examples: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Scatter and lines multiple lines different colors, shapes and sizes.
 - X axis, Y axis, and 45 degree line.
 - **m**: `xline(0) + yline(0) + refline([1 0]) + plot(x,y) + HandleVisibility + Color + LineStyle + LineWidth`
3. Three variables Scatter and Lines with Color Spectrum: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Two dimensional matrix for x and y, a third variable with color spectrum set via loop.
 - **m**: `plot(2d, 2d) + jet + set(chart(m), 'Color', clr)`

A.3.3 Section 3.3 Write and Read Plots links

1. Graph Generate EPS Postscript Figures: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - EPS vector graphics, avoid bitmap (jpg, png), use vector graphics.
 - **m**: `figure('Renderer', 'Painters')`

A.4 Tables links

A.4.1 Section 4.1 Basic Table Generation links

1. Named Tables with Random Data: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Convert a random matrix to a table with column and row names defined with arrays.
 - **m**: `array2table() + strcat() + addvars() + matlab.lang.makeValidName()`
2. Order and Sort Columns: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Convert a matrix to table with mean and sd columns. Rearrange columns.
 - **m**: `array2table() + rng() + movevars() + matlab.lang.makeValidName() + tb.Properties.VariableNames + tb.Properties.RowNames`
3. Array Based Row and Column Names: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Generate a column and row named table. Convert row names to a column.
 - **m**: `array2table() + strcat('rowA=', string((1:size(mt, 1)))) + tb_test_a.Properties.VariableNames + tb_test_a.Properties.RowNames + addvars(tb, rownames, 'Before', 1)`

A.4.2 Section 4.2 Table Joining links

1. Stack Matlab Tables: [mlx](#) | [m](#) | [pdf](#) | [html](#)
 - Append columns to existing table. Stack tables vertically and horizontally.

- **m:** `array2table()` + `[tb_a tb_b]` + `[tb_a; tb_b]` + `tb.Properties.VariableNames` + `tb.Properties.RowNames`

A.5 Panel links

A.5.1 Section 5.1 Time Series links

1. [Autoregressive Process AR\(1\): **mlx** | **m** | **pdf** | **html**](#)
 - The Mean and standard deviation of an AR(1) process.
 - Simulate and graph an AR(1) persistent process.
 - **m:** `normrnd()` + `for it_t=1:1:length(ar_shk)` + `plot(ar_t, ar_y)`
