

Matlab Accumarray Examples

back to [Fan's Reusable Matlab Repository](#) or [Dynamic Asset Repository](#).

Accumarry Basic Example

There are three unique values in ar_a, sum up the probabilities for each of the unique states. This is equivalent to sorting a matrix with a and prob, and computing sum for each.

```
ar_a = [3,2,1,3]';  
ar_prob = [0.1,0.2,0.31,0.39]';  
ar_sumprob = accumarray(ar_a, ar_prob);  
tb_summed_prob = table(sort(unique(ar_a)), ar_sumprob);  
disp(tb_summed_prob);
```

Var1	ar_sumprob
1	0.31
2	0.2
3	0.49

Accumarry For Discrete Random Variable

Upon solving a model, if we look for the mass at certain choices or states, accumarray could help aggregate up probabilities

```
a1 = [1,1,2,2]
```

```
a1 = 1x4  
1 1 2 2
```

```
a2 = [3,2,1,3]
```

```
a2 = 1x4  
3 2 1 3
```

```
a3 = [1,2,3,3]
```

```
a3 = 1x4  
1 2 3 3
```

```
a = [a1;a2;a3]'/2
```

```
a = 4x3  
0.5000 1.5000 0.5000  
0.5000 1.0000 1.0000  
1.0000 0.5000 1.5000  
1.0000 1.5000 1.5000
```

```
prob_a = zeros(size(a)) + 1/12
```

```
prob_a = 4x3  
0.0833 0.0833 0.0833  
0.0833 0.0833 0.0833
```

```
0.0833    0.0833    0.0833
0.0833    0.0833    0.0833
```

```
[ar_idx_full, ~, ar_idx_of_unique] = unique(a)
```

```
ar_idx_full = 3x1
    0.5000
    1.0000
    1.5000
ar_idx_of_unique = 12x1
     1
     1
     2
     2
     3
     2
     1
     3
     1
     2
     .
     .
```

```
mt_idx_of_unique = reshape(ar_idx_of_unique, size(a))
```

```
mt_idx_of_unique = 4x3
     1     3     1
     1     2     2
     2     1     3
     2     3     3
```

```
accumarray(mt_idx_of_unique(:,1), prob_a(:,1))
```

```
ans = 2x1
    0.1667
    0.1667
```

```
accumarray(mt_idx_of_unique(:,2), prob_a(:,2))
```

```
ans = 3x1
    0.0833
    0.0833
    0.1667
```

```
accumarray(mt_idx_of_unique(:,3), prob_a(:,3))
```

```
ans = 3x1
    0.0833
    0.0833
    0.1667
```
